

8 October

Hi Timothy,

I'd start with one shared automation register before choosing what to build.

For each process, I'd write down the team, the manual step, what can go wrong, who is affected, the suggested fix, the tool choice, estimated effort, and founder approval status. That fits the sequence you named: observe, identify, research, propose, then build.

It would give the long-term hire a practical way to bring ideas without turning every idea into a workflow. The first builds should come from the rows with the clearest failure risk or time waste.

Allen
